Description xxi, 290 pages : illustrations ; 23 cm

Content text

Media unmediated

Carrier volume

Bibliography Includes bibliographical references (pages 251-275) and index.

Contents Part I. Thinking: understanding the climate paradox. The psychology of climate paradox -- "Climate is the new Marx": the many faces of skepticism and denial -- The human animal, as seen by evolutionary psychology -- How climate facts and risks are perceived: cognitive psychology -- What others are saying: social psychology -- The roots of denial: the psychology of identity -- The five psychological barriers to climate action -- Part II. Doing: if it doesn't work, do something else. From barriers to solutions -- The power of social networks -- Reframing the climate messages -- Make it simple to choose right -- Use the power of stories to re-story climate -- New signals of progress -- Part III. Being: inside the living air. The air's way of being -- Stand up for your depression! -- Climate disruption as symptom: what is it trying to tell us? -- Re-imagining climate as the living air -- It's hopeless and I'll give it my all.

Time-Varying Response of ENSO-Induced Tropical Pacific Rainfall to Global Warming in CMIP5 Models. Part I: Multimodel Ensemble Results.

Authors: Huang, Ping

Source: Journal of Climate. Aug2016, Vol. 29 Issue 16, p5763-5778. 16p.

Document Type: Article

Subject Terms: *CLIMATIC changes
*GLOBAL warming
*RAIN & rainfall
*GLOBAL temperature changes
*ENVIRONMENTAL degradation

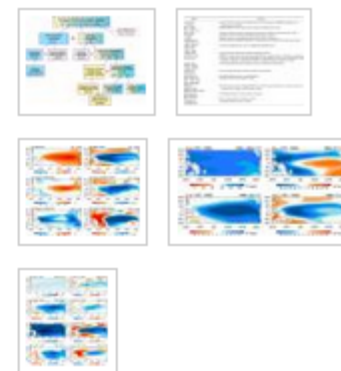

Author-Supplied Atm/Ocean Structure/ Phenomena

Keywords: Climate change
Climate models
ENSO
Models and modeling
Moisture/moisture budget
Physical Meteorology and Climatology
Rainfall

Abstract: El Niño-Southern Oscillation (ENSO) is one of the most important drivers of climatic variability on the global scale. Much of this variability arises in response to ENSO-driven changes in tropical Pacific rainfall. Previous research has shown that the ENSO-driven tropical Pacific rainfall variability can shift east and intensify in response to global warming, even if ENSO-related SST variability remains unchanged. Here, the twenty-first century changes in ENSO-driven tropical Pacific rainfall variability in 32 CMIP5 models forced under the representative concentration pathway 8.5 (RCP8.5) scenario are examined, revealing that the pattern of changes in ENSO-driven rainfall is not only gradually enhanced but also shifts steadily eastward along with the global-mean temperature increase. Using a recently developed moisture budget decomposition method, it is shown that the projected changes in ENSO-driven rainfall variability in the tropical Pacific can be primarily attributed to a projected increase in both mean-state surface moisture and spatially relative changes in mean-state SST, defined as the departure of local SST changes from the tropical mean. The enhanced moisture increase enlarges the thermodynamic component of ENSO rainfall changes. The enhanced El Niño-like changes in mean-state SST steadily move the dynamic component of changes in ENSO-driven rainfall variability to the central-eastern Pacific, along with increasing global-mean temperature.
